Smart contract development traditional workflow

1. **Graphical tool** for specification development - collaborative SaaS based on diagram design approach
2. **Translator** turns Solidity code into form acceptable for proof assistant - automation app for instant mathematical proof preparation
3. **Highly sophisticated plug-in for VS code** - created from set of libraries
4. **Randomised testing** - automatic bug hunting app allows to find most deeply hidden bugs
5. **Deductive formal verification app** - automatically compares specification and implementation proving if smart contract 100% correct against formulated spec
6. **On-chain smart contracts monitoring** - dashboard and API, detection with alerts and threat prevention
